

光字

01 双缝干涉

1. 相干光

分波阵面法, 分振幅法

2. 光程差

① 光是电磁波, 具有波动性.

光程: nr . 折射率 $\times$ 几何路程.

光程差: $\delta = nr_2 - nr_1$

相位差: $\Delta\varphi = \frac{2\pi}{\lambda} \delta$

3. 杨氏双缝干涉

① 光程差: $\delta = r_2 - r_1 = \frac{dx}{D}$

② $\delta = \begin{cases} \pm 2k \cdot \frac{\lambda}{2} & \text{明纹 } (k=0, 1, 2, \dots) \\ \pm (2k+1) \cdot \frac{\lambda}{2} & \text{暗纹 } (k=0, 1, 2, \dots) \end{cases}$

③ 明暗条纹间距: $\Delta x = \frac{D\lambda}{d}$

④ 明纹位置: $x = \pm 2k \cdot \frac{D\lambda}{d}$
暗纹: $x = \pm \frac{2k+1}{2} \cdot \frac{D\lambda}{d}$

⑤ 可见明纹最大级数: $k_{\max} = \frac{d}{\lambda}$ (取整)

eg: $n_1=1.4, n_2=1.7$, 覆盖玻璃片后原中央明纹0变为第5级明纹, $\lambda=480\text{nm}$, 求玻璃片厚度d.

解: 覆盖前: $\delta = r_2 - r_1 = 0$.

覆盖后: $\delta = (r_2 - d + n_2 d) - (r_1 - d + n_1 d) = 5\lambda$

02 薄膜干涉

1. 等倾干涉

(1) 光程差: $\delta = 2nd \cos r + \frac{\lambda}{2}$

垂直入射时:

(2) 光程差: $\delta = 2nd + \frac{\lambda}{2} = \begin{cases} k\lambda & \text{明} \\ \frac{(k+1)\lambda}{2} & \text{暗} \end{cases}$

若有一个半波损失则加.

- ① 膜右反射面
- ② 光疏到光密有, 光密到光疏无.

eg:

透射增强 $\Leftrightarrow$ 反射相消.

1.38		
1.52		

$$\delta = 2nd = (2k+1) \frac{\lambda}{2}$$

$$\Rightarrow d = \frac{(2k+1)\lambda}{4n} = \frac{\lambda}{4n} \text{ (最小)}$$

(k取0)

2. 劈尖干涉

光程差: $\delta = 2nd + \frac{\lambda}{2} = \begin{cases} k\lambda \\ (2k+1)\frac{\lambda}{2} \end{cases}$

相邻两明暗条纹高度差: $\Delta h = \frac{\lambda}{2n}$

条纹间距: $\sin\theta = \frac{\lambda}{2n}$

$\theta \sim \sin\theta \sim \tan\theta$

明纹从1开始, 暗纹从0开始. (有 $\frac{\lambda}{2}$ 时) 左凹右凸
没有 $\frac{\lambda}{2}$ 时从0开始.

3. 牛顿环

$\delta = 2nd + \frac{\lambda}{2}$

明纹半径 $r = \sqrt{\frac{(2k-1)R\lambda}{2n}}$

暗纹半径 $r = \sqrt{\frac{kR\lambda}{n}}$

4. 迈克耳逊干涉仪

$d = N \cdot \frac{\lambda}{2}$

移动距离 $\rightarrow$ 移动系数

03 单缝衍射、光栅衍射

1. 单缝衍射

缝宽 a. 衍射角 θ . 焦距 f.

$\delta = a \sin\theta = \begin{cases} \pm k\lambda & \text{暗} \\ \pm (2k+1)\frac{\lambda}{2} & \text{明} \end{cases}$

中央明条纹宽: $\Delta x_0 = \frac{2f\lambda}{a}$

次级明条纹宽: $\Delta x = \frac{f\lambda}{a}$

明中心位置: $x = \pm \frac{2k+1}{2} \cdot \frac{f\lambda}{a}$

暗中心位置: $x = \pm k \frac{f\lambda}{a}$

半角宽度: $\sin\theta = \frac{\lambda}{a}$
 θ 很小时 $\theta = \frac{\lambda}{a}$

2. 光栅衍射

光栅方程: $(a+b)\sin\theta = \pm k\lambda$ 明纹 ($k=0, 1, 2, \dots$)

光栅常数: $d = a+b$

主级大最大级数: $k = \frac{a+b}{\lambda}$ (取整)

缺级: $k = \frac{a+b}{a} k' (k' = \pm 1, \pm 2, \dots)$

04 偏振光

1) 马吕斯定理

$I_1 = \frac{1}{2} I_0$

$I_2 = I_1 \cos^2\alpha$

2) 布儒斯特定律

① 反射光为线偏振光 (完全偏振) 垂直于入射面

② 折射光为部分偏振光

③ 反射光与折射光垂直: $i_B + r = \frac{\pi}{2}$

④ $\tan i_B = \frac{n_2}{n_1}$
